nine-cis-epoxycarotenoid dioxygenase homolog F28J12.10 - Arabidopsis thaliana N;Alternate names: hypothetical protein T9A21.200
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 23-Apr-1999 #sequence_revision 23-Apr-1999 #text_change 11-Jun-1999
C;Accession: T04531; T04937
R;Bevan, M.; Hilbert, H.; Braun, M.; Holzer, E.; Brandt, A.; Duesterhoeft, A.; submitted to the Protein Sequence Database, February 1998
A;Reference number: Z15377
A,Accession: T04531
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A;Cross-references: EMBL:Z49484; NID:g1015590; PIDN:CAAB9506.1; PID:g1015591; GSPDB:GNO.R;Purnelle, B.; Coster, F.; Goffeau, A.

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                              Score

FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAQUE BECOME THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGREGATION OF HACTERIAL CELLS AND FOOD DEBRIS.

CATALYTIC ACTIVITY: Sucrose + { (1,6)-alpha-D-glucosyl} (N) = D-frictose + { (1,6)-alpha-D-gl
                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: Belongs to family 70 of glycosyl hydrolases.
SIMILARITY: Contains 6 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Microbiol.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THO TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAÇUE OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE T AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

CATALYTIC ACTIVITY: Sucrose + {(1,6)-alpha-D-glucosyl}(N) = fructose + {(1,6)-alpha-D-glucosyl}(N+1).

SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: Belongs to family 70 of glycosyl hydrolases. SIMILARITY: Contains 19 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MISCELLANBOUS: GTF-I SYNTHESIZES WATER-INSOLUBLE G

"A complete sequence of T. tengcongensis genome.";
Genome Res. 12:689-700(2002).
-I-CATMALTRIC ACTIVITY: ATP + L-aspartate + tRNA(Asp) = AMP +
diphosphate + L-aspartyl-tRNA(Asp).
-I-SUBCULTLULAR LOCATION: Cytoplasmic.
-I-SUBCILLULAR LOCATION: Cytoplasmic.
-I-SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.

SIMILARITY: Contains 1 umuC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        in untargeted mutagenesis. Copies undamaged DNA at stalled replication forks, which arise in vivo from mismatched or mismaligned primer ends. These mismaligned primers can be extended by pollV. Exhibits no 3.5' exonuclease (proofreading) activity. May be involved in translesional synthesis (By similarity). CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate

The arresting sites in DNA have the property of trapping a certain fraction of elongating RNA polymerases that pass through, resulting in locked ternary complexes. Cleavage of the nascent transcript by cleavage factors such as greA or greB allows the resumption of elongation from the new 3'terminus. GreA releases sequences of 2 to 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: Belongs to the greA/greB family.

Science 270:397-403(1995).

-i-FUNCTION: Necessary for efficient RNA polymerase transcription
-i-FUNCTION: Dast template-encoded arresting sites. The arresting
sites in DNA have the property of trapping a certain fraction of
elongating RNA polymerases that pass through, resulting in locked
ternary complexes. Cleavage of the nascent transcript by cleavage
factors such as grea or greB allows the resumption of elongation
from the new 3'terminus. Grea releases sequences of 2 to 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      between the Swiss Institute of Bioinformatics and the EMBL OUTSTATION the EUROpean Bioinformatics Institute. J. Bacteriol. 179:2363-2372(1997).
- IPUNCTION: Required for synthesis of the major beta-glucans of the cell wall (By similarity).
- ISUBCELLULAR LOCATION: Type II membrane protein.
- I- SIMILARITY: STRONG, TO KRE6.

"Nucleotide sequence of the brome mosaic virus genome and its
implications for viral replication.";
J. MOL. Biol. 172:369-383(1984).
-i. FUNCTION: MAY BE INVOLVED IN THE REPLICATION OF THE VIRUS.
CONTAINS AN HELICASE DOMAIN AND A METHYLTRANSFERASE DOMAIN.
METHYLTRANSFERASE DOMAIN IS PROBABLY INVOLVED IN VIRAL RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NCBI_TaxID=12302;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bromovirus
